Design Molded Plastics Creates Jobs with New Facility

Company sees increase in U.S.-sourced projects

Macedonia, Ohio: Design Molded Plastics, a custom thermoplastic injection molding company, has recently purchased a 48,000-square-foot facility. The new space, which is adjacent to their current 62,000-square-foot headquarters, will allow the company to further develop its research and development capabilities.

The facility will provide additional space for light assembly of products and storage, as well as engineering offices.

“We are being presented with projects that customers are sourcing back to the U.S. from China,” said Jay Honsaker, President of Design Molded Plastics. “This new facility will allow us to continue to support the needs of our current customers, as well as providing the needed space to develop and launch future products.”

Honsaker added, “We also anticipate that the additional space will lead to both immediate and eventual job openings at Design Molded Plastics.”

Started in 1985, Design Molded Plastics is a family-owned business with a reputation for providing outstanding technical capabilities and finely manufactured products through the use of automated injection molding equipment. The company is considered expert manufacturers of components for medical, automotive, protective equipment, home appliance and electronic products. More information about Design Molded Plastics is available at www.designmolded.com.
